

Video Compression for areaDetector

Alex Sobhani

ADVideoCompression

- EPICS IOC interfaces to libavcodec, which handles variety of codecs
- areaDetector frames sent to libavcodec context object, compression is controlled by interface functions, then packets are broadcast via PVAccess
- Each packet corresponds to a frame but compression is not frame-level because preceding packets are also used in reconstruction.

Decompression

- Compressed video packets broadcast by PVAccess can be decompressed by an ImageJ plugin that was developed
- Java wrapper to ADSupport C functions like existing areaDetector decompression plugins

Future plans

- Performance testing needed to compare with existing compression methods
- Approval to make video compression/decompression plugins open source
